- The experiment 4 can also be carried out using FPGA design flow tools. It is required to set appropriate constraints in FPGA advanced synthesis options
- Use library files and technology files below 180 nm to carry out the experiments.

**Experiment 1:** Capture the schematic of CMOS inverter with load capacitance of 0.1pF and set the widths of inverter with  $W_n = W_p$ ,  $W_n = 2W_p$ ,  $W_n = W_p/2$  and length at selected technology. Carry out the following analysis:

- Set the input signal to a pulse with rise time, fall time of 1ns and pulse width of 10ns and time period of 20ns and plot the input voltage and output voltage of designed inverter.
- From the simulation results compute  $t_{pHL}$ ,  $t_{pLH}$  and  $t_d$  for all three geometrical settings of width.
- Tabulate the results of delay and find the best geometry for minimum delay CMOS inverter.

**Experiment 2:** Draw layout of CMOS inverter with  $W_p/W_n = 40/20$ , use optimum layout methods. Verify for DRC and LVS.

Also familiarise the tools available for floor planning, placement, routing and Generation of GDS II reports.
